**Transfer Function Formula**

**Humidity**

$$RH = \frac{100}{2^{10}} \times RH_{IC} \quad (0 \sim 100 \% RH)$$

RH<sub>IC</sub> : IC Humidity Output Data (10 bit)

Refer to Register Map:

RH<sub>IC</sub> = Data of the addresses 04H and 05H (000h ~ 3FFh)  
It changes into a decimal and is operation.

**Temperature**

$$T = [T_{IC} - (2^{10} - \frac{25}{0.1})] \times 0.1 \quad (-30 \sim 100 \text{ } ^\circ\text{C})$$

T<sub>IC</sub> : IC Temperature Output Data (11 bit)

Refer to Register Map:

T<sub>IC</sub> = Data of the addresses 06H and 07H (000h ~ 7FFh)  
It changes into a decimal and is operation.

## Output Type Waveform and Data Read/Write Procedure

### I<sup>2</sup>C-BUS Data Read-out Procedure

- ① I<sup>2</sup>C master device releases START condition.
- ② I<sup>2</sup>C master device transmits slave address and WRITE mode selection.
- ③ I<sup>2</sup>C master device transmits register address of this IC.
- ④ I<sup>2</sup>C master device releases repeated START condition. (Release method is same as START condition.)
- ⑤ I<sup>2</sup>C master device again transmits slave address and READ mode selection. (Read mode can be selected by transmitting "1" in 8th bit.)
- ⑥ I<sup>2</sup>C master device reads-out data from register address designated at ③.  
It is possible to read-out data while register address increments one, by reading-out multiple data continuously. However, during continuous read-out, please return ACK to this IC as a reply of master.
- ⑦ After the completion of all read-out, I<sup>2</sup>C master device releases STOP condition.

## Output Type Waveform and Data Read/Write Procedure (Continued)

### I<sup>2</sup>C-BUS Data Write-in Procedure

- ① I<sup>2</sup>C master device releases START condition. (Start condition can be released by changing SDA from “H” to “L” while SCL is in “H” state.)
- ② I<sup>2</sup>C master device transmits slave address and WRITE mode selection. (Write mode can be selected by transmitting “0” in 8th bit while 1~7th bits are slave address.)
- ③ I<sup>2</sup>C master device transmits register address of this IC.
- ④ I<sup>2</sup>C master device transmits write-in data.
- ⑤ It is possible to write-in data while register address increments one, by transmitting multiple write-in data continuously.

After the completion of transmitting all write-in data, I<sup>2</sup>C master device releases stop condition. (Stop condition can be released by changing SDA from “L” to “H” while SCL is in “H” state.)

## Solder Profile

Processing Method: Reflow soldering with infrared heat or forced air convection (only once).

### Notes:

1. No clean solder paste is recommended.
2. Aqueous wash is not recommended.
3. Use of water soluble soldering flux should be avoided due to possible corrosion.
4. Multiple passes through the soldering process is not recommended.
5. Other SMD processes and profiles should be verified by the customer.
