Features

- Formerly a Riedon™ product
- 24-bit isolated shunt current sensor with CANbus interface
- 100 A (2 kA peak), 250 A (5 kA peak), or 500 A (10 kA peak) or 1000 A (20 kA peak)
- 1500 VDC reinforced galvanic isolation
- 16-bit +150 °C microcontroller
- 24-bit ADC with buffered analog inputs
- ECC flash memory with autocorrect single bit errors
- Internal and external CRC data error detection
- Advanced non-linear temperature compensation
- RoHS compliant*

BOURNS®

SSD Series – Riedon™ Digital Current Sensor with CANbus Interface by Bourns

Specifications

Characteristic	SSD-100A	SSD-250A	SSD-500A	SSD-1000A
Nominal Current (A)	±100	±250	±500	±1000
Peak Current (No Clipping)	+2 kA / -1 kA	+5 kA / -2.5 kA	+10 kA / -5 kA	+20 kA / -10 kA
Shunt Resistance ($\mu\Omega$) Excluding primary termination resistance	300	120	60	30
Initial Accuracy	< ±0.1 %			
Linearity Over Current Range	< ±0.1 % + 5 mA	< ±0.1 % + 13 mA	< ±0.1 % + 25 mA	< ±0.1 % + 50 mA
Bandwidth	5 kHz			
ADC Resolution	24 bits			
Speed (readings per second)	up to 1100 rps (0.9 - 4200 ms per reading)			
Supply Voltage	5 - 60 VDC			
Typical Supply Voltage (See Shunt Supply Voltage Requirements on Page 2)	*@ 5.0 V, 55 mA typical		**@ 24 V, 15 mA typical	
DC Bus Voltage Range	±1200 VDC max. (10 M input impedance)			
CAN Interface	CAN 2.0 A Speeds: 125 K, 250 K, 500 K (default), 1 M baud			
Long Term Stability	< ±0.3 % 1000 hours 115 °C terminal temperature			
Galvanic Isolation	1500 VDC 1000 VAC RMS (maximum continuous working voltage)			
Dielectric Strength	3500 VAC RMS 1 minute			
Operating Temperature	-40 °C to +115 °C ambient -40 °C to +125 °C primary conductor (see derating curve on page 2)			
Storage Temperature	-55 °C to +125 °C			

Materials (RoHS Compliant)

Resistance Element.....................CuMnNi
Current Terminal[1].....Nickel-plated copper
Electronics Housing..............94-V0 rated

Note:
1 Suitable for copper, copper-clad aluminum or aluminum conductors

How to Order

SSD - 100A - C - T

Model
Amps
    100A = 100 A
    250A = 250 A
    500A = 500 A
    1000A = 1000 A
Interface
    C = CANbus (Industrial Version)
Option
    Blank = Standard
    -T = Internal 120 Ω Termination Resistor (Industrial Version Only)

Product Safety Notice

The SSD Series Digital Current Sensor must be used in a manner specified by this data sheet, otherwise the protection provided by the equipment may be impaired. The SSD Series should not be treated as a structural part of the installation and must be properly supported on both ends.

CALIFORNIA WARNING: Can expose you to lead, a carcinogen and reproductive toxicant.
See www.P65Warnings.ca.gov

Applications

■ EV charging stations
■ Battery systems
■ Renewable energy
■ Motor drives

Specifications (continued)

| Model	Typical Noise (mA RMS) per ADC Reading Interval (ms), 1.25X Range, Zero Current															
	0.9	1.6	3.2	4.8	6.4	7.2	9	13	26	51	102	205	410	820	1640	3280

Includes	**Molex P/N**	**Description**
1 pc.	1053071204	4-Pin Female
1 pc.	1053071202	2-Pin Female
6 pcs.	1053002200	20-22 AWG Female Crimp Terminals
1 pc.	1053251004	4-Pin TPA
1 pc.	1053251002	2-Pin TPA

Optional SSD Serial Connection Kit

SSD-SERKIT
Serial Connection Kit	
Includes	**Description**
1 pc.	SSD to DB-9F Serial Adapter
1 pc.	5 VDC USB Power Cable
1 pc.	4-Pin Programming Cable (1 m Length)

The SSD serial connection kit simplifies the initial setup of the SSD Series Digital Current Sensor. It includes the necessary components to connect USB to CAN and USB to RS-485 serial adapters that have a 9-pin DB-9 male output connector. It includes jumpers to switch from RS-485 to CANbus and enable a termination resistor. USB to serial adapter not included.

USB to RS-485 Adapter - From DTEK, StarTech and others with RS-485 on DB9 pins 1 and 2 and the ground on pin 5. Note: Some adapters have the 485A and 485B pins reversed.

USB to CANbus adapter - From PEAK, Kvaser and others with CAN on DB9 pins 2 and 7 and the ground on pin 3.

Frequently Asked Questions

Q: Is it necessary to install the SSD Series on the low side of the circuit?

A: The SSD Series Digital Current Sensor is completely isolated, so it may be installed in either the low or high side of the circuit.

Q: The sensor is only sending whole Coulombs and Watt-hours, how precise are these?

A: Internally, micro-coulombs and micro-joules are counted; so very short ADC timing intervals and very low currents are accurately counted.

Q: What is the best way to connect to the SSD Series terminals?

A: Make sure connections are clean and well prepared. Bolts to be torqued to the hardware manufacturer's recommendations. There should be sufficient clamping force to ensure proper connection. Overlap shown below should be taken as a minimum. Suitable for Copper, Copper-Clad Aluminum or Aluminum conductors.
Q: What is the best way to cool the SSD Series Digital Current Sensor?

A: A majority of the heat generated by the SSD Series is dissipated through the primary conductors. Care should be taken to ensure that the primary conductors are sized appropriately given expected amperage and conductor length. Bourns recommends a 115 °C maximum conductor temperature at rated current. If there are thermal concerns, oversizing the conductors will help minimize the operating temperature of the Digital Current Sensor.

Q: When should I use the SSD version with the internal 120 Ω termination resistor (-T)?

A: The -T version includes a built-in 120 Ω resistor between CANH/CANL or 485A/485B. Typical RS485 or CANbus networks require termination at two endpoints. Use the -T version accordingly. Avoid using more than two termination points to ensure proper communication.

Q: What size wire is suitable for the SSD Series?

A:

Copper Conductor Ampacity Ratings (continuous)					
mm²	AWG	Amps (75 °C)	mm²	AWG	Amps (75 °C)

SSD Interface Manual (continued)

0x00 – Command GET ALL ENABLED – Read Only

Used to get all enabled readings in the SETMODE command. Current, Temperature, Vbus, etc…

	Message ID	Length	Data Fields (LSB First)					
SEND	0x3FB	0x01	0x00					
RECEIVE	Multiple replies from all enabled readings in the SETMODE Command							

0x01 – Command GET CURRENT – Read Only

Used to get the last sensor current reading in milliamps.

Reply is 4 bytes from CAN ID 0x3F1 (default) - Intel Format (Data Byte 0 = LSB)

	Message ID	Length	Data Fields (LSB First)					
SEND	0x3FB	0x01	0x01					
RECEIVE	0x3F1	0x04	0xXX	0xXX	0xXX	0xXX		

0x02 – Command GET TEMPERATURE – Read Only

Used to get the last sensor temperature reading in 0.1 centigrade.

Reply is 4 bytes from CAN ID 0x3F2 (default) - Intel Format (Data Byte 0 = LSB)

	Message ID	Length	Data Fields (LSB First)					
SEND	0x3FB	0x01	0x02					
RECEIVE	0x3F2	0x04	0xXX	0xXX	0xXX	0xXX		

0x03 – Command GET VBUS – Read Only

Used to get the last external bus voltage reading in milli-Volts.

Reply is 4 bytes from CAN ID 0x3F3 (default) - Intel Format (Data Byte 0 = LSB)

	Message ID	Length	Data Fields (LSB First)					
SEND	0x3FB	0x01	0x03					
RECEIVE	0x3F3	0x04	0xXX	0xXX	0xXX	0xXX		

0x04 – Command GET COULOMB – Read / Write

Used to get or set the last coulomb count which is continuously updated with current.

Note: The coulomb reading can overflow! It is up to the user to check if very large values ($> \pm 2^{60}$) are expected. See 0x07 command to read overflow bit.

Reply is 8 bytes from CAN ID 0x3F4 (default) - Intel Format (Data Byte 0 = LSB)

Note: Writing a new value is limited to signed int32 values.
Example: Write 500,000 (0x7A120) to coulomb counter

Write Message

	Message ID	Length	Data Fields					
SEND	0x3FA	0x05	0x04	0x00	0x07	0xA1	0x20	
RECEIVE	(none)							

Read Message

	Message ID	Length	Data Fields (LSB First)							
SEND	0x3FB	0x01	0x04							
RECEIVE (int64)	0x3F4	0x08	0xXX	0xXX	0xXX	0xXX	0xXX	0xXX	0xXX	0xXX

0x05 – Command GET POWER – Read Only

Used to get the last power reading in 0.1 watts.

Reply is 4 bytes from CAN ID 0x3F5 (default) - Intel Format (Data Byte 0 = LSB)

	Message ID	Length	Data Fields (LSB First)					
SEND	0x3FB	0x01	0x05					
RECEIVE	0x3F5	0x04	0xXX	0xXX	0xXX	0xXX		

0x06 – Command GET ENERGY – Read Only

Used to get the last energy count in Watt-hours (Wh) which is continuously updated.

Note: The energy reading can overflow! It is up to the user to check if very large values ($> 2^{60}$) are expected. See 0x07 command to read overflow bit.

Reply is 8 bytes from CAN ID 0x3F6 (default) - Intel Format (Data Byte 0 = LSB)

	Message ID	Length	Data Fields (LSB First)							
SEND	0x3FB	0x01	0x06							
RECEIVE (int64)	0x3F6	0x08	0xXX	0xXX	0xXX	0xXX	0xXX	0xXX	0xXX	0xXX

SSD Interface Manual (continued)

0x07 – Command GET ERRORS/Alerts – Read Only

Used to get any errors or alerts which are continuously updated.
Reply is 2 bytes from CAN ID 0x3F7 (default) - Motorola Format (Big Endian)

	Message ID	Length	Data Fields (LSB First)					
SEND	0x3FB	0x01	0x07					
RECEIVE	0x3F7	0x02	0xXX	0xXX				

Returned ERROR / ALERT bits															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N/A	1 = ECC Single Bit	1 = EEPROM Corrupt	1 = EEPROM R/W	1 = ADC Initialization	1 = ADC CRC Read	1 = Energy Overflow	1 = Coulomb Overflow	1 = Power Over Limit	1 = Vbus Over Limit	1 = Vbus Under Limit	1 = Temp Over Limit	1 = Current Over Limit	1 = Current Under Limit	1 = Current Range Over	1 = Vbus Range Over

Bit0 Vbus Range Over – Bus Voltage exceeds the MAX voltage for the range selected, see **0X17** command.

Bit1 Current Range Over – Peak current exceeded the range selected, see **0X17** command.

Bit2 Current Under Limit – Current is below the limit set, see **0X18** command.

Bit3 Current Over Limit – Current is above the limit set, see **0X19** command.

Bit4 Temp Over Limit – Temperature is above +125 °C or the limit set, see **0X1A** command.

Bit5 Vbus Under Limit – Bus Voltage is below the limit set, see **0X1B** command.

Bit6 Vbus Over Limit – Bus Voltage is above the limit set, see **0X1C** command.

Bit7 Power Over Limit – Power is above the limit set, see **0X1D** command.

Bit8 Coulomb Overflow – Coulombs have exceeded the range of $\pm 2^{47}$.

Bit9 Energy Overflow – Energy has exceeded 2^{48}.

Bit10 ADC CRC Read – The ADC's CRC doesn't match the calculated CRC of the returned data.

Bit11 ADC Initialization – The ADC's initialized registers don't match the written values.

Bit12 EEPROM R/W – Error reading or writing to the internal EEPROM.

Bit13 EEPROM Corrupt – The EEPROM CRC doesn't match saved value.

Bit14 ECC Single Bit Error – Flash Memory had an Auto-Correctable Error.

0x10 – Command RESET COMMAND – Write Only

Rebooting will restore previously saved settings if current settings are not saved. This will prevent baud rate or address errors since you will need to connect with the new values before you can issue the save to EEPROM command.

> 0x0001 – Reset Coulomb and Energy counters
> 0x0004 – Reset Errors
> 0x000F – Save settings to EEPROM
> 0X00AA – Reset settings to defaults (command must be sent 3X in a row)

Example: To save settings to EEPROM

	Message ID	**Length**	**Data Fields**					
SEND	0x3FA	0x03	0x10	0x00	0x0F			
RECEIVE	(none)							

0x11 – Command SET IDs – Write Only

Used to change the default SSD CAN bus IDs to different ID numbers.

Example: To change the default CURRENT CAN ID from 0x03F1 (1009) to 0x04B0 (1200)

	Message ID	**Length**	**Data Fields**					
SEND	0x3FA	0x05	0x11	0x03	0xF1	0x04	0xB0	
RECEIVE	(none)							

NOTE: No settings are saved until a save settings to EEPROM command is issued!
Power cycling will restore previous settings. See command 0x10 0x000F.

SSD Interface Manual (continued)

0x12 – Command SETMODE – Read / Write

Used to change the sensor options.

Bit0 Invert Current – This will flip the Current and Coulomb signs if necessary.

Bit1 Autorange – Sensor will switch to high range if reading exceeds 85 % of standard range. It will switch back when reading drops to below 50 % of standard range. See A2D CONFIG for more info.

Bit2 Modbus Enable – Not used on CANbus version.

Bit3 Auto Reset Errors – Self clears errors once sent or read, the error will re-enable if it persists.

Bit4 Invert Voltage – Use for Highside Voltage Measurements.

Bit7 Send on Conversion – The sensor will send the latest data as soon as available per A2D CONFIG.

Bit8 Autosend – The sensor will send readings at the Read Delay timer interval unless Bit7 is enabled.

Bit9 to Bit15 – Enable the readings to be automatically sent. Otherwise read them manually.

SETMODE Configuration Bytes															
HEXCODE: Check boxes below to calculate HEX value

NOTE: No settings are saved until a save settings to EEPROM command is issued!
Power cycling will restore previous settings. See command 0x10 0x000F.

SSD Interface Manual (continued)

0x12 (Continued) - Command SETMODE - Read / Write

SETMODE default is: 0x0002.

Example: To enable Autosend, Send Current, Send Errors, Auto Reset Errors (0x8308)

Write Message

	Message ID	Length	Data Fields					
SEND	0x3FA	0x03	0x12	0x83	0x08			
RECEIVE	(none)							

Read Message

	Message ID	Length	Data Fields					
SEND	0x3FB	0x01	0x12					
RECEIVE	0x3FC	0x03	0x12	0x83	0x08			

NOTE: No settings are saved until a save settings to EEPROM command is issued!
Power cycling will restore previous settings. See command 0x10 0x000F.

0x14 – Command BAUD RATE – Read / Write

Used to set the SSD CAN bus Baud Rate. Values other than the following are ignored.

HEX Value	Baud Rate (kbit/s)
0x0009	125
0x000A	250
0x000B	500
0x000C	1000

Notes: Baud rate is changed immediately so you may get an error after change. Connect using new baud rate and use Command RESET MODE (0x10 0x000F) to save current settings to EEPROM. If unable to connect, reboot to restore the previous setting. BAUD RATE is defaulted to: 0x000B (500 kb/s).

Example: To set Baud Rate to 250 kbps

Write Message

	Message ID	Length	Data Fields					
SEND	0x3FA	0x03	0x14	0x00	0x0A			
RECEIVE	(none)							

Read Message

	Message ID	Length	Data Fields					
SEND	0x3FB	0x01	0x14					
RECEIVE	0x3FC	0x03	0x14	0x00	0x0A			

NOTE: No settings are saved until a save settings to EEPROM command is issued!
Power cycling will restore previous settings. See command 0x10 0x000F.

0x16 – Command SET READING DELAY - Read / Write

Used to set the delay between readings automatically sent to the CANbus. Autosend must be enabled (see SETMODE bit8). Note: If the Conversion Time is greater than the reading delay, the sensor will send the same value until the next set of readings is available. For readings faster than 5 ms use SETMODE Bit7 Send on Conversion. This will send the data as soon as it's available.

Delay value from 5 to 60000 milli-seconds. READING DELAY default is: 0x03E8 (1 s).

Example: To set delay to 1 second between readings, 1 s = 1000 = 0x03E8

Delay (ms)	HEX Value

CONVERT

Write Message

**NOTE: No settings are saved until a save settings to EEPROM command is issued!
Power cycling will restore previous settings. See command 0x10 0x000F.**

0x17 (Continued) – Command A2D CONFIG – Read / Write

Set the bits required for the application.

Notes:

High Range must be greater than or equal to the Normal Range. If SETMODE Bit1 (Autorange) is not set High Range will be ignored. If it is set, the sensor will automaitcally switch between the two ranges specified when necessary.

Reading intervals 13 ms and below utilize hardware averaging, 26 ms and above start using software averaging with a 13 ms hardware interval time. If it is necessary to capture and report fast current spikes, use fast reading intervals otherwise they will be averaged out.

Set the Vbus MAX voltage to the highest peak voltage expected. If using the sensor on the highside with voltage measuring, use 300 VDC range or lower.

A2D CONFIG default is: 0x035D.

Example: Vbus Max Voltage 1200 VDC, High Range 5X Nominal, Normal Range 1.25X Nominal, Reading Interval 820 ms (0x035D)

Power cycling will restore previous settings. See command 0x10 0x000F.**

0x18 – Command CURRENT UNDER LIMIT – Read / Write

Used to configure the optional lower limit for current readings. Currents below this value will cause an error that can be read with the 0x07 GET ERRORS command if errors aren't automatically sent. A zero value disables this alert, non-zero values enable alert.

Value is a signed Int16 in amps. Default CURRENT UNDER LIMIT: 0x0000 (Disabled).

Example: Set the lower limit to 25 amps (0x0019)

<div align="center">

Power cycling will restore previous settings. See command 0x10 0x000F.

0x1A – Command TEMP OVER LIMIT – Read / Write

Used to configure the temperature limit for the error. Temperatures above this value will cause an error that can be read with the 0x07 GET ERRORS command if errors aren't automatically sent.

Value is an unsigned Int16 in centigrade. Default TEMP OVER LIMIT: 125 °C (0x007D, Cannot Disable)

Valid Range: 0 °C to +125 °C (MAX)

Example: Set the upper limit to 90 °C (0x005A)

Temp. (°C)   HEX Value

Power cycling will restore previous settings. See command 0x10 0x000F.**

0x1D – Command POWER OVER LIMIT – Read / Write

Used to configure the optional upper limit for power readings. Power above this value will cause an error that can be read with the 0x07 GET ERRORS command if errors aren't automatically sent. A zero value disables this alert, non-zero values enable alert.

Value is an unsigned Int32 in Watts. Default POWER OVER LIMIT: 0x00000000 (Disabled).

Example: Set the upper limit to 22000 Watts (0x000055F0)

Power cycling will restore previous settings. See command 0x10 0x000F.**

SSD Interface Manual (continued)

0x1E – Command SHUNT NANO-OHMS - Read / Write

Used to override the resistance of the Model SSD Series from the factory calibration. This is typically not necessary and the correct equipment is essential to properly set it. Value can be reset back to factory defaults.

Value is an Int32

Example: To set SHUNT NANO-OHMS to 300156 (0x0004947C) nano-ohms

<div align="center">

Nano-Ohms   HEX Value

Power cycling will restore previous settings. See command 0x10 0x000F.

0x22 – Command VBUS FACTOR – Read / Write

Used to adjust the Bus Voltage reading from the factory calibration. This is typically not necessary and the correct equipment is essential to properly set it. See reset command to set the value back to factory default. Voltage is calibrated at 25 °C. Power and Energy values are scaled appropriately.

Value is an Int16. Value is divided by 10000 in firmware to create the factor.

Example: To set VBUS FACTOR to 10023 (0x2727)

<div style="text-align:center">

Vbus Factor   HEX Value

SSD Interface Manual (continued)

0x25 – Command GET T0 TEMPERATURE COMPENSATION – Read Only
0x26 – Command GET T1 TEMPERATURE COMPENSATION – Read Only
0x27 – Command GET T2 TEMPERATURE COMPENSATION – Read Only

Used to get the factory calibrated settings for the temperature compensation constants.

T0 - unsigned int16
T1 - signed int32
T2 - signed int32
Example: The following shows T1 compensation constant of FFBE E23D (-4267459)

Read Message

	Message ID	Length	Data Fields					
SEND	0x3FB	0x01	0x26					
RECEIVE	0x3FC	0x05	0x26	0xFF	0xBE	0xE2	0x3D	

NOTE: No settings are saved until a save settings to EEPROM command is issued!
Power cycling will restore previous settings. See command 0x10 0x000F.

0x28 – Command GET RESET CAUSES – Read Only

Used to get the reasons for the last four SSD sensor restarts.

Example: The following shows abnormal restarts (0x0140)

Read Message

	Message ID	Length	Data Fields					
SEND	0x3FB	0x01	0x28					
RECEIVE	0x3FC	0x03	0x28	0x01	0x40			

<div align="center">

3rd Last Reason: Brown-out ————————————

2nd Last Reason: Watchdog ————————————

Last Reason: Normal ——————————————————

Reason Codes
0 - Normal Power-on Reset
1 - Brown-out Reset
4 - Watchdog Timer Time-Out Reset
6 - Software RESET Instruction
7 - Master Clear Pin Reset
9 - Configuration Mismatch Reset
E - Illegal Condition Device Reset
     - Illegal Opcode Reset
     - Uninitialized W Register Reset
     - Security Reset
F - Trap Conflict Reset

0x30 – Command GET FIRMWARE VERSION – Read Only

Used to get the SSD firmware version. Data Returned: Version (byte) and subversion (byte)

Example: The following shows version (v1.2)

Read Message

	Message ID	Length	Data Fields					
SEND	0x3FB	0x01	0x30					
RECEIVE	0x3FC	0x03	0x30	0x01	0x02			

0x31 – Command GET SERIAL NUMBER – Read Only

Used to get the SSD serial number.

Example: The following shows SN:00012345 (0x3039)

Read Message

	Message ID	Length	Data Fields					
SEND	0x3FB	0x01	0x31					
RECEIVE	0x3FC	0x05	0x31	0x00	0x00	0x30	0x39	

NOTE: No settings are saved until a save settings to EEPROM command is issued!
Power cycling will restore previous settings. See command 0x10 0x000F.

SSD Interface Manual (continued)

Firmware Revisions-

v2.10
Added Invert Bus Voltage bit to SETMODE command for highside sensor mounting.

v2.11
Updated internal ADC settings to reduce noise. This reduces some of the fixed ADC reading intervals.
Fixed reading Coulombs and Energy manually after changing CAN IDs.
v2.12
Bus Voltage is now signed int32, ±1200 VDC.
Current and Voltage Under and Over limits are now signed int16.
Can now write Coulomb value to sensor and the sensor will count from there.
Get all enabled readings changed from register 0x08 to 0x00.

BOURNS®

REV. 11/25
